EXPERIENCE

EnergyHub

Remote

Software Engineer II

Apr 2024 – Present

- Took an embedded analytics platform from spec to production as sole technical owner: implemented JWT auth backed by a Java/Spring endpoint and AWS Parameter Store, built reusable React embed components, and documented the integration thoroughly enough that later engineers picked up the workstream from the docs alone.
- Built the customer-facing flow for a new grid load management product across React frontend and Java backend; launched on deadline, rolled out to 12 utility clients by Q3 2026.
- Rewrote legacy Backbone.js/jQuery/Handlebars views as React during a year-plus, multi-engineer migration of a customer-facing portal out of a Java monolith; read legacy implementations, mapped endpoints, and shipped rewrites at parity behind feature flags and staged client rollouts.
- Co-led the rewrite of the portal's primary admin view for customer enrollments: scoped the page into per-widgit rewrites and shipped the bulk of the implementation.
- Led cross-team communication and rollout coordination for a multi-team rewrite of core admin pages, driving open-question resolution across product, design, and a partner team so decisions landed before they blocked implementation.
- Onboarded a remote frontend engineer onto a launch-critical codebase by writing tickets detailed enough to enable async cross-timezone delivery; he shipped independently throughout the launch, and the team gained a capable frontend contributor.
- Established release automation for the team's React SPA and rebuilt its QA deploy workflow around per-environment version targeting via AWS Parameter Store, cutting safe pre-release deploys from an hour to minutes and eliminating version-clobbering collisions across QA environments.

Software Engineer I

Feb 2023 – Apr 2024

- Built the React/TypeScript frontend of an internal configuration tool on a 4-person team, replacing manual program-setup processes with a validated self-service interface for non-technical users; shipped on schedule with no post-launch bugs.
- Migrated the tool's form validation to schema-based patterns (React Hook Form + Yup) and authored shared validation documentation that became the team's reference.

Packetized Energy (later acquired by EnergyHub)

Burlington, VT

Software Developer Intern

Sept 2020 – Dec 2020

- Shipped features across the React/Redux frontend and AWS Lambda backend of a SPA managing distributed energy resources.

EDUCATION

University of Vermont

Burlington, VT

B.S. Computer Science

Sept 2018 – May 2022

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Java, Python

Frameworks & Libraries: React, TanStack Query, React Router, React Hook Form, MUI

Backend: Spring Boot, MongoDB, gRPC

Testing: Jest, Testing Library, Mock Service Worker (MSW), Storybook, Playwright

Infrastructure & Build: GitHub Actions, AWS (Parameter Store, S3), Webpack, Yarn
